

The time is now for a new teleradiology platform that includes cutting-edge solutions to solve common workflow and reporting problems in medical imaging.

Called TeleRad360, this new platform is designed to help hospitals and imaging teams easily view, report, manage, and stay accountable for every diagnostic exam. It's the first one-step, cloud-based solution of its kind to meet the needs of radiologists and diagnostic image professionals working in imaging centers, clinics and hospitals. Radiologists no longer have to worry about buying hardware or software – all they need to do is subscribe.

TeleRad360 was created by experts with hands-on experience in the field of radiology and exam management. OffSite Image Management, Inc., a leader in vendor neutral archiving services based on open architecture design and industry enterprise archiving standards, created TeleRad360 in partnership with Integrated Modular Systems Inc. (IMSI).

TeleRad360

Do Any of These Problems Sound Familiar?

- › Image priority levels change too rapidly; this is a problem that affects the way you order medical images and deliver diagnostic results.
- › You have no control over your reporting and workflow of diagnostic images.
- › Prioritizing and moving exams is difficult because of a lack of access.
- › Exams get lost in the "black hole" of technology.
- › Radiologists spend too much time on exam management rather than results and reports.

If so, it's time to consider TeleRad360, which addresses all of these challenges.

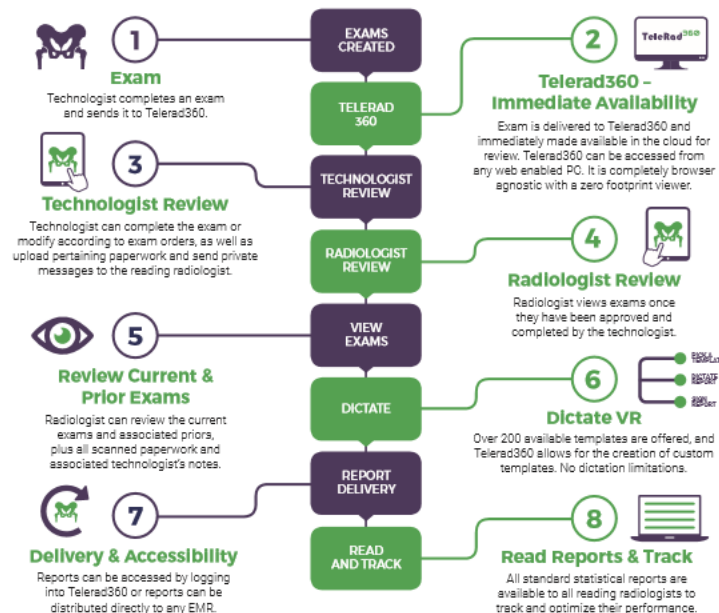

TeleRad360 Solves Your Problems. In One Step.

Exam management and segregation are among the top challenges for teleradiology. Mixed with manual data "scrubbing" and irrational workflow, this creates nightmares for referring facilities. TeleRad360 addresses the way data is managed as it comes from multiple facilities through the use of logical rules.

Communication issues also create recurring problems for teleradiologists. With a simple built-in messenger, radiologists and technologists are able to communicate and eliminate the process of jumping from one phone number to another in order to get a simple response.

Features Include:

- › Radiology worklist management
- › Report distribution
- › Mobile friendly functionality and design
- › Voice recognition
- › Worklist management
- › Browser agnostic viewer
- › Cloud PACS
- › Integrated RIS
- › "Plug and play" set-up

What You Get When You're Signed Up with TeleRad360:

Our goal is to give hospitals and providers more control over their images and their workflow. That's why OffSite and Integrated Modular Systems Inc., developed a number of benefits and solutions that make TeleRad360 an industry-leading solution. Here are just a few of the benefits you get when you bring TeleRad360 on board:

- › Automated report distribution
- › Automated worklist management
- › Multilevel worklist management
- › Complete workflow transparency
- › Vendor Agnostic VR with built in templates
- › Unlimited report generation

How it Works

The workflow is simple and transparent. It begins when the provider sends an exam to TeleRad360.

Once images are sent to TeleRad360, the radiologist's reading worklist is immediately updated. The radiologists and hospitals are all held accountable because the system, which is simplified and transparent, allows everyone to see the exam status across the enterprise. This accountability helps with improved exam management and better patient care.

The voice recognition and self-editing tools allow radiologists to edit their reports immediately without waiting on a transcriptionist. TeleRad360 ensures that no one is losing track of patients in the process and the technologist can see when the radiologist has finalized the report.

Reports can be imported directly into the local EMR, printed from the TeleRad360 Portal or electronically delivered to any destination. The radiologist and hospital can use the data analytics within TeleRad360 for strategic analysis and planning.

Because every record is easily accessed and the workflow is visible to everyone, all participating parties are held accountable not only to improve record management – but to also improve patient outcomes.

SCENARIO

Facility has a STAT exam and needs the report immediately.

SOLUTION: Technologist marks the exam STAT on the Technologist Worklist, which moves the exam to the top of the radiologist's worklist. Technologist can send a private message to the radiologist via TeleRad360 messenger reminding the radiologist that call report has been requested.

SCENARIO

Radiologist needs to view all available prior records for the patient.

SOLUTION: TeleRad360 will provide a list of all prior reports and scanned files for the given patient. It will also launch a browser agnostic viewer with all available prior exams matched by patient ID.

SCENARIO

Radiologist needs to dictate an addendum to the report.

SOLUTION: All reports are held in preliminary status for 5 minutes before finalized. This allows the radiologist to edit the file without actually dictating an addendum. Radiologist also has an option to create multiple addendums to the original report as needed, which would be placed just above the original report.

SCENARIO

Technologist needs to send exam notes to the radiologist.

SOLUTION: Technologist can provide all exam notes within the provided field and scan additional paperwork through the "upload" function. If by accident the wrong paperwork has been uploaded, the technologist can re-upload the right paperwork which overrides the original upload.
